

CERAMIC MOSAIC

Standardized Sheets and Patterns

✓ adopted by the members of

THE ASSOCIATED TILE MANUFACTURERS

[Publications]

This publication is conceived as the first section of a much more comprehensive one on this subject which is in preparation. It represents the first results of the standardization work covering ceramic mosaic effected by the Associated Tile Manufacturers, and should be considered as preliminary to a more complete publication.

Definition

Ceramic Mosaic is the accepted collective term for unglazed dust-pressed tiles one-quarter inch thick and less than two and one-quarter square inches in area, which are produced in a variety of sizes, shapes and colors.

Mounting

These tiles are usually marketed in sheet units, i. e., the individual tiles or tesserae are properly spaced and mounted on sheets of paper, since this enables the tilesetter to apply several hundred tesserae at one time. The mounting paper is removed after the tiles have been set.

Standardization of Sheet Sizes

In the mounting process the tiles are assembled either in sheets of one color or in patterns of two or more colors. When setting sheets in one color, so-called "plain" or "solid" sheets, they can be joined to each other in block fashion or staggered without in any particular way affecting the result. But patterned sheets must be laid in a definite way to insure a uniform repeat of the pattern motif. It is for this reason that the number of rows of tesserae per sheet formerly varied according to the design and because the size of sheet was adjusted to the requirements of the design. In this publication, however, all patterns are based on uniform sizes of sheets for each kind of Ceramic Mosaic, and the designs are adapted to the size of sheet. The widest variety within the limits of economical production is still retained and the development of new or special patterns is directed into the channels of standardization. Dimensions, areas, number of tesserae per square foot and other data for the various standardized sheets will be found on page 3.

Color Chart

The colors shown in the chart on page 2 represent typical or average shades of the colors in which ceramic mosaic is usually manufactured, and it should be thoroughly understood that these shades are not constants but indicate the general character of the color and will vary according to producer. The color nomenclature has been held in simple terms to avoid misunderstanding.

Additional Information on Pages 31 and 32

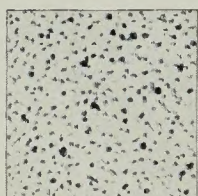

Publication No. K-500.

STANDARDIZED SHEETS

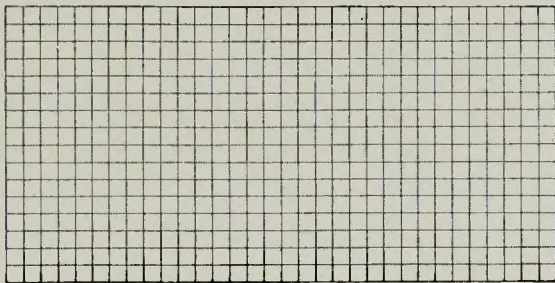

The illustrations on this page represent the sheet units in which ceramic mosaic is marketed under the standardization plan. The sizes of these units were determined upon the assumption that a sheet approximately 1' x 2' could be handled most conveniently and efficiently, and that the number of rows of tiles per unit should provide the greatest possible number of common divisors, which in turn would assure the greatest possible variety of arithmetical repeat blocks.

According to the shape and size of the tesserae, the sheets differ in size, number of tiles, number of rows, and mounting plan. This information is given under each illustration.

These standardized units are furnished in any of the colors shown on the opposite page or in the patterns on the following pages.

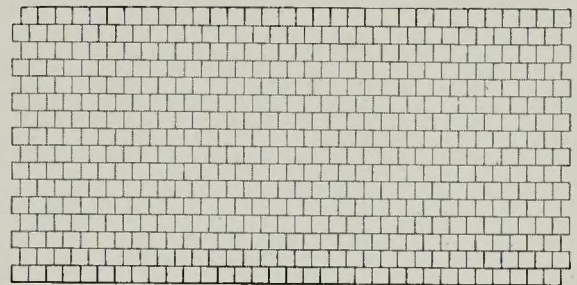

For plain sheets, i. e., units in one color, it is sufficient to specify or order by sheet number as shown and color, since the number indicates size and shape of tile as well as mounting plan.

Numbering

The letters and numbers shown in connection with each standardized sheet, pattern, border, or trimmer will definitely identify the desired sheet or trimmer in specifications and orders. The prefix "C" should never be omitted since it serves as a distinguishing symbol from other factory numbers.

Plain Colors Without Pattern

Sheets in any solid color, without pattern, are furnished in the standardized sizes shown on page 3. Orders for plain colors should be placed by number of standardized sheet and color.

Patterns

The patterns and borders reproduced in this book have been selected from the catalogs of the different manufacturers. This publication therefore serves as a composite catalog for all members of the Associated Tile Manufacturers, and thus enables the architect, the contractor and the buyer of tiles generally, to make his selection from a single book instead of having to consult a dozen or more.

Borders and Corners

The borders are all furnished in the same unit lengths as the long side of the standardized sheets. All border designs have been selected with a view of forming corners from the running lengths of the border without cutting the tiles. Special corners are therefore not required. The examples on pages 24 to 29 will illustrate the formation of typical corners.

Changes in Colors

The color combinations of the patterns shown in this publication are not fixed, but can be varied to any desired combination. The pattern numbers apply only to the design, i. e., the arrangement of the individual tiles into a pattern, and not to the color combination. Changes in the color combination from those shown in the book should be clearly specified, since orders for any pattern without instructions as to colors will be filled in accordance with the colors shown in this book.

Trimmers

The standardized trimmer shapes shown on page 30 can be furnished in any of the colors shown on the color chart. Orders for trimmers should therefore specify not only number and letter symbols, but also the colors in which the trimmers are to be furnished.

Grades

Ceramic Mosaic is marketed in one grade only—"Selected." The producers have available, however, from time to time, a small quantity of white tesserae in the different shapes and sizes, which are marketed as "Commercial" grade. This commercial grade consists of tiles which are either slightly "specked," chipped, underfired, have a rough surface, or other slight blemishes.

For the protection of the consumer, members of the Associated Tile Manufacturers will furnish, upon request, certification of the grade on the special form of grade certificate of the Association and it is recommended that the furnishing of such certificates be stipulated in

specifications for tilework. A facsimile of the grade certificate will be found in Publication K-200, Basic Information, and on the back cover of Publication K-300, Basic Specification for Tilework.

Joints

The normal joint between the individual mounted tiles is approximately $\frac{1}{16}$ ". This width should be considered as average. Slight variations in the width of joints do not however affect the nominal size of the sheets, nor their area.

Special Colors and Sizes

In addition to the colors and sizes shown in this publication as standards, the manufacturers produce a number of special colors, sizes and textures which vary in characteristics according to producer, but may be used in place of those shown in the standardized designs. For characteristics of other kinds of Ceramic Mosaic, such as Glazed Mosaic, Cut Mosaic, Faience Mosaic, etc., see Publication K-200, Basic Information, page 12.

Specifications

For methods of setting ceramic mosaic see Publication K-300, Basic Specification for Tilework and Related Documents.
